# SNP JOURNAL

A reference ebook for the  
FOUNDATIONS IN NUTRIGENOMICS course

Name

Education

## Welcome to the SNP JOURNAL

The SNP JOURNAL ebook has been developed to provide you with clear and concise information on the SNPs you will most commonly encounter in commercial nutrigenetic tests. The list of SNPs is by no means comprehensive, but is an excellent place to start. The SNP JOURNAL provides an easy to use reference ebook for the course, as well as for clinical practice.

In the Table of Contents the SNPs have been divided into the three modules of the Foundations course, where you will encounter them. By clicking on the name of the SNP you will be taken to the relevant page.

For each SNP we have provided you with the following information:

• An overview of the gene	• Impact of SNP on biological pathway/s
• Full name of the gene	• Nutrient interaction
• Symbol of the gene	• Established diet-gene interactions
• Nucleotide/base change	• Potential dietary recommendations
• Amino acid change (where appropriate)	• References
• Population frequencies	

In addition, you will be able to make notes alongside each SNP as you proceed through the course and SNP JOURNAL. You will be able to save these notes and edit them, as you proceed, making the SNP JOURNAL, - YOUR SNP JOURNAL. A working document for your growing knowledge.

The SNP JOURNAL will also be available for purchase as a printed book, should you work better that way.

## Module

1

<u>ANGIOTENSIN 1 CONVERTING ENZYME (ACE) INSERTION/DELETION</u>	6
<u>ANGIOTENSINOGEN (AGT) -6 G&gt;A</u>	8
<u>CYTOCHROME P450 1A2 (CYP1A2 A&gt;C)</u>	12
<u>HUMAN LEUKOCYTE ANTIGEN (HLA) GENE HAPLOTYPE</u>	16
<u>HEMOCHROMATOSIS GENE (C282Y and H63D)</u>	20
<u>LACTASE (LCT) -13910 C&gt;T (or MCM6)</u>	24
<u>FATTY ACID DESATURASE (FADS) 592 G&gt;T RS174537</u>	28

## Module

2

<u>CYTOCHROME P450 1B1 (CYP 1B1) 1294 C&gt;G VAL432LEU</u>	32
<u>CYTOCHROME P450 1A1 (CYP1A1) Ile462Val A&gt;G and 6235 T&gt;C</u>	36
<u>CATECHOL-O-METHYLTRANSFERASE (COMT) G&gt;A VAL158MET</u>	40
<u>GLUTATHIONE S-TRANSFERASES (GSTM1, GSTT1 and GSTP1)</u>	44
<u>APOLIPROTEIN A5 (APOA5) -1131 T &gt; C</u>	48
<u>APOLIPOPROTEIN C3 (APOC3) 3175 C&gt;G</u>	52
<u>APOLIPOPROTEIN E (APOE) ARG-CYS 112 and 158 (E2, E3, E4)</u>	56
<u>QUINONE REDUCTASE (NQO1) 609 C&gt;T</u>	62
<u>CYSTATHIONINE <math>\beta</math>-SYNTHASE (CBS) 699 C&gt;T</u>	66
<u>TRANSCRIPTION FACTOR 7-LIKE 2 GENE (TCF7L2) IVS3 C&gt;T</u>	70
<u>SOLUTE CARRIER FAMILY 2 (SLC2A2) OR GLUT2 THR110ILE C&gt;T</u>	74
<u>CHOLESTERYL ESTER TRANSFER PROTEIN (CETP) TAQ1B 279 G&gt;A</u>	78
<u>LIPOPROTEIN LIPASE (LPL) 1595 C&gt;G S447X</u>	82

Module

<b>2</b>	<u>METHYLENETETRAHYDROFOLATE REDUCTASE (MTHFR) 1298 A&gt;C</u>	86
	<u>5-METHYLTETRAHYDROFOLATE-HOMOCYSTEINE METHYLTRANSFERASE (MTR) 2756 A&gt;G</u>	90
	<u>METHIONINE SYNTHASE REDUCTASE (MTRR) 66 A&gt;G</u>	94
	<u>APOLIPOPROTEIN A-1 (APOA1) -75 G&gt;A</u>	98
	<u>ENDOTHELIAL NITRIC OXIDE SYNTHASE (ENOS3) GLU298ASP G&gt;T</u>	102
	<u>HEPATIC LIPASE (LIPC or HL) -514 C&gt;T</u>	106
	<u>METHYLENETETRAHYDROFOLATE REDUCTASE (MTHFR) 677 C&gt;T</u>	110
	<u>MANGANESE SUPEROXIDE DISMUTASE (SOD2 or MNSOD) V16A or 47 T&gt;C</u>	114

Module

<b>3</b>	<u>BETA2-ADRENERGIC RECEPTOR GENE (ADRB2) ARG16GLY A&gt;G, GLN27GLU C&gt;G</u>	118
	<u>β3-ADRENERGIC RECEPTOR (ADRB3) TRP64ARG T&gt;C</u>	122
	<u>APOLIPOPROTEIN A2 (APOA2) -492 T&gt;C</u>	126
	<u>DOPAMINE RECEPTER D2 (DRD2) TAQ1A C&gt;T</u>	130
	<u>FATTY ACID BINDING PROTEIN (FABP2) ALA54THR G&gt;A</u>	134
	<u>FAT MASS AND OBESITY ASSOCIATED GENE (FTO) T&gt;A</u>	138
	<u>MELANOCORTIN 4 RECEPTOR (MC4R) T&gt;C</u>	142
	<u>PERILIPIN (PLIN1) 11482 G&gt;A</u>	146
	<u>PEROXISOME-PROLIFERATOR ACTIVATED RECEPTOR GAMMA (PPARG) C&gt;G PRO12ALA</u>	150
	<u>TUMOR NECROSIS FACTOR ALPHA GENE (TNFA) -308 G&gt;A</u>	154
	<u>INTERLEUKIN-6 (IL-6) -174 G&gt;C</u>	158
	<u>CIRCADIAN LOCOMOTOR OUTPUT CYCLES KAPUT (CLOCK) 3111 T&gt;C</u>	162

## ANGIOTENSIN 1 CONVERTING ENZYME (ACE) INSERTION/DELETION

<b>Overview</b>	Salt sensitivity is estimated to be present in 51% of hypertensive and 26% of normotensive populations. The ACE gene codes for the angiotensin-converting enzyme and is part of the renin-angiotensin system, which controls blood pressure by regulating the volume of fluids in the body.
<b>Name of gene</b>	Angiotensin 1 converting enzyme (ACE) gene
<b>Symbol of gene</b>	ACE
<b>rs number</b>	rs4646994
<b>Base change</b>	The presence or absence (insertion or deletion) of the enzyme is based on a 287 bp Alu repeat element in the gene
<b>Population Frequency</b>	<ul style="list-style-type: none"> <li>• Non-hispanic whites DD=28.8%, ID=51%, II=19.6%</li> <li>• Non-hispanic black DD=33.8%, ID=49.8%, II=16.4%</li> <li>• Mexican American DD=20.7%, ID=51.9%, II=27.4%</li> </ul>
<b>Impact of SNP on biological pathway/s</b>	Levels of circulating enzyme are associated with the presence or absence of the (rs4646994 ) 287 bp Alu repeat in this gene. The deletion means there is no enzyme activity.
<b>Nutrient interaction</b>	Sodium
<b>Established diet-gene interactions</b>	<ul style="list-style-type: none"> <li>• Meneton et al. found that the prevalence of salt sensitive hypertension in those with the II genotype and ID genotype were significantly higher than DD genotype.</li> <li>• Zhang et al. found that in individuals with the ID+II genotype, hypertension was increased by a high salt intake, while in the DD genotype it was not. The interaction was more prominent in the overweight group than in the non-overweight group.</li> </ul>

# ANGIOTENSIN 1 CONVERTING ENZYME (ACE) INSERTION/DELETION

<b>Potential dietary recommendations</b>	In those patients with hypertension and with the ID or II genotype, aim to eat no more than 2,300 milligrams (approximately 1 level teaspoon of salt) of sodium per day.

Genomics and pharmacogenomics of salt-sensitive hypertension. <i>Current hypertension reviews</i>.</li><li>• Hunt, S. C., Cook, N. R., Oberman, A., Cutler, J. A., Hennekens, C. H., Allender, P. S., . . . Williams, R. R. (1998). Angiotensinogen genotype, sodium reduction, weight loss, and prevention of hypertension: trials of hypertension prevention, phase II. <i>Hypertension</i>, 32(3), 393-401.</li><li>• <a href="http://www.nutritionfoundation.org.nz/nutrition-facts/minerals/sodium">http://www.nutritionfoundation.org.nz/nutrition-facts/minerals/sodium</a></li></ul>

## Notes

<b>Overview</b>	The angiotensinogen gene has been linked to essential hypertension and increased blood pressure. A functional AGT gene variant has been associated with hypertension and has been shown to affect blood pressure response to sodium and weight reduction, and the development of hypertension.
<b>Name of gene</b>	Angiotensinogen (AGT) gene
<b>Symbol of gene</b>	AGT
<b>rs number</b>	rs5051. The AGT -6 G>A is in full linkage disequilibrium with the rs699, often written as M235T
<b>Base change</b>	G>A
<b>Population Frequency</b>	<ul style="list-style-type: none"> <li>• European GG=21.7%, GA=65.2%, AA=13%</li> <li>• African American GG=4.2%, GA=25%, AA=70.8%</li> <li>• Asian GG=7%, GA=41.9%, AA=51.2%</li> </ul>
<b>Impact of SNP on biological pathway/s</b>	The AGT -6 G>A gene variant has been demonstrated to be functional and is believed to contribute towards hypertension susceptibility. The A allele alters the binding of a nuclear protein, resulting in increased gene transcription compatible with increased angiotensinogen levels.
<b>Nutrient interaction</b>	Sodium
<b>Established diet-gene interactions</b>	Hunt et al. reported that AA genotype individuals develop hypertension to a greater degree than those with the other genotypes when there is no intervention, they also respond more favorably to salt reduction and/or weight loss intervention. Whereas the GG genotype group may comprise primarily salt-insensitive individuals.

<p><b>Potential dietary recommendations</b></p>	<p>In those patients with hypertension, and with the AA genotype, aim to eat no more than 2,300 milligrams (approximately 1 level teaspoon of salt) of sodium per day. Weight loss should also be encouraged where appropriate.</p>

Notes

<b>Overview</b>	Twin studies reveal that genetics plays a role in individual variability in caffeine consumption as well as in the direct effects of caffeine. At low doses, caffeine effects include mild euphoria, alertness, and enhanced cognitive performance, but at higher doses, it can produce nausea, anxiety, trembling, and jitteriness. Caffeine is metabolized primarily by the CYP1A2 enzyme, and accounts for approximately 95% of caffeine metabolism. The clearance of caffeine can vary up to 40-fold within and between individuals.
<b>Name of gene</b>	Cytochrome P450 1A2
<b>Symbol of gene</b>	CYP1A2
<b>rs number</b>	rs762551
<b>Base change</b>	A>C
<b>Population Frequency</b>	<ul style="list-style-type: none"> <li>• European AA=54.2%; AC=33.3%; CC=12.5%</li> <li>• African American AA=26.1%; AC=56.5%; CC=17.4%</li> <li>• Asian AA=41.7%; AC=54.2%; CC=4.2%</li> </ul>
<b>Impact of SNP on biological pathway/s</b>	The occurrence of the CYP1A2 C allele leads to a decreased enzyme inducibility, resulting in impaired caffeine metabolism.
<b>Nutrient interaction</b>	Caffeine

<p><b>Established diet-gene interactions</b></p>	<ul style="list-style-type: none"> <li>• Individuals who are homozygous for the CYP1A2 A allele (AA genotype) are “rapid” caffeine metabolizers, whereas carriers of the variant CYP1A2 C allele are “slow” caffeine metabolizers (AC and CC genotypes).</li> <li>• Cornelis et al. reported that increased coffee intake is associated with an increased risk of non-fatal MI, but only among individuals with the “slow” C allele.</li> <li>• Palatini et al. demonstrated that carriers of the “slow” A allele are at increased risk of hypertension.</li> </ul>
<p><b>Potential dietary recommendations</b></p>	<p>For the general population it is recommended to drink coffee or caffeine containing products in moderation. I.e. consuming 3-4 cups (300-400 mg) of coffee per day. Slow metabolizers may do better restricting coffee to less than 2 cups of coffee per day and monitoring their overall caffeine intake.</p>
